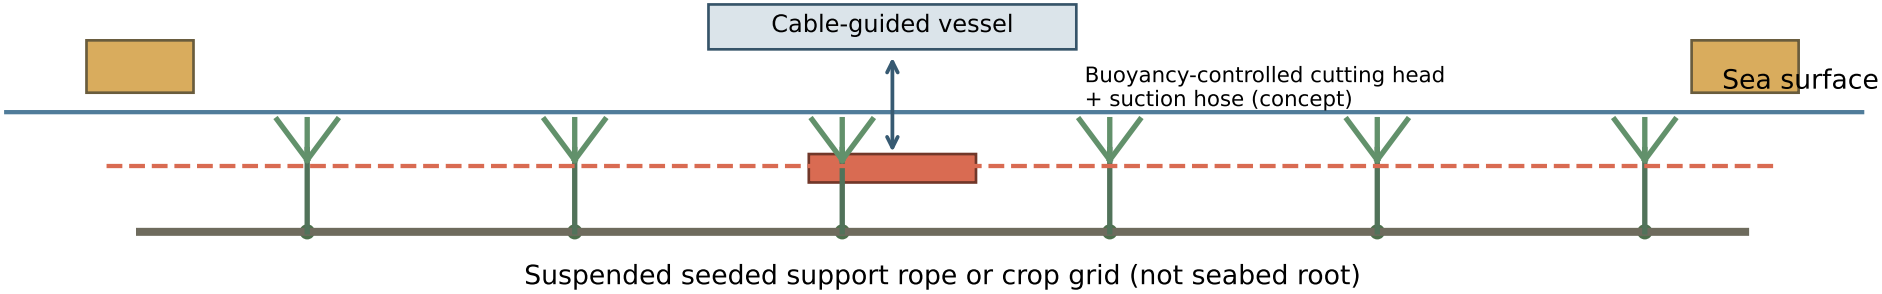
Fig. S10. Testable Grid Harvester selective-trimming concept (not an observed farm layout)



Dashed: selective canopy trim plane; retained lower tissues required

1. First selective pass: retain viable fronds, basal growth tissues and anchors

2. Allow regrowth if biologically demonstrated on suspended crops

3. Second pass only if field data confirm net annual dry yield > single full harvest

Evidence distinction: Northern Chile partial-harvest wild plants regrew (Borrás-Chávez et al. 2012);

Camus et al. (2018) reported NO regrowth after mowing their shallow suspended Chilean crops.
